

### **Volcal for earthwork calculations**

Jog Software Solutions Ltd, a sister concern of Jog Engineers, Pune has developed a special software offering benefits to all those firms that are involved in the earthmoving activities. *Volcal* provides solution for the huge volume of work involved in the measurements and calculations of digging and filling of the earth. It is a complete volume calculator which provides graphical presentation of data. It validates the data before printing. It performs all tasks accurately in a short time. It has easy controls and is well designed for customisation. It has the ability to handle multiple projects from the same

application with that of central data repository. The data can be accepted from the file as well as manually. It provides extremely flexible output generation giving the user a control over the position, font size, titles and values. The software is capable of giving the output in batch print mode.

Another feature of the software is that it allows the user to estimate the workload in advance which is essentially required during the pre-tendering phase of the project. Software engineers alongwith the civil engineers and field personal are

constantly involved in updating the software. *Volcal* can also be made available in a customised version to meet special needs.
